control with a control; (2) treating (M1) an individual with a cell cycle related disorder, which involves administering to the individual an inhibitor of TaHo; (3) a recombinant nucleic acid (II) encoding (I), comprising a nucleic acid that hybridizes under high stringent conditions to a sequence complementary to the 3797 base pair sequence of ADY97759 or the 3816 base pair sequence of ADY97759 or ADY97760; (II) comprising (II) operably linked to regulatory sequences recognized by a host cell (IV) transformed with the nucleic acid (5) a host cell comprising (II) of producing (I); (7) a polypeptide that specifically binds to (I); and (8) inhibiting (M2) growth of a tumor of cell, involves contexting the tumor with a bloactive agent capable of inhibiting TaHo activity. (I) is useful for screening a bloactive agent capable of modulating (I), or screening for agents capable of interfering inhibiting growth of a tumor cell by a bloactive agent capable of individual with a cell cycle related disorder. (M2) is useful for inhibiting growth of a tumor cell by a bloactive agent e.g. antisense collowing in a tumor cell by a bloactive agent e.g. antisense collowing in a tumor cell by a bloactive agent e.g. antisense collowing in a proper cell cycle related disorder. (M2) is useful for human tankyrase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                homologue isotype 1.

The invention relates to a recombinant polypeptide (I) such as cell cycle protein e.g. tankyrase homologue (TaHo). Comprising an amino acid sequence having 85% or more acquence identity to the 1065 amino acid sequence of ADY97761 or the 1240 amino acid sequence of ADY97762. Also described (I) diagnosing cancer, which involves determining the activity of (I) from a test sample of an individual and comparing the level with a control with a control; (2) treating (MI) an individual with a cell cycle

```
inhibitor of TaHo; (3) a recombinant nucleic acid (II) encoding (I); comprising a nucleic acid that hybridizes under high stringent conditions to a sequence complementary to the 3797 base pair sequence of ADY97759 or the 3816 base pair sequence of ADY97759 or ance sequence identity to ADY97760, or a nucleic acid having 85% or more sequence identity to ADY97759 or ADY97760; (4) an expression vector (III) comprising (II) operably linked to requising exceptions are comprising (II) or (III); (6) producing (I); (7) a polypeptide that comprising (II) or (III); (6) producing (I); (7) a polypeptide that comprising (II) or (III); (6) producing (I); (7) a polypeptide that comprising (II) or (III); (6) producing (II); (7) a polypeptide that comprising (II) or (III); (8) producing (II); (9) a bloactive agent capable of inhibiting TaHo activity. (I) is useful for screening a bloactive agent capable of inhibiting of (I), or screening for agents capable of interfering with the binding of (I), or screening for agents capable of individual with a cell cycle related disorder. (M2) is useful for individual with a cell cycle related disorder. (M2) is useful for contacting prowth of a tumor cell by a bloactive agent e.g. antisense be appresent sequence represents a human tankyrase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             homologue isotype 1 mutant protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel recombinant nucleic acid encoding the cell cycle protein TaHo, a tankyrase H isoform. The products of the invention have cytostatic and immunostimulant activity and can be used for gene therapy and in vaccines. The cell cycle protein TaHo and the nucleic acid encoding the protein are useful for diagnosing and treating a cell cycle related disorder, e.g. cancer, or for inhibiting growth of a tumour cell. The methods are useful for screening for a bloactive agent capable of binding to a cell cycle protein tankyrase H, or a bloactive gent capable of modulating a cell cycle protein tankyrase H or PARP (poly ADP-tibose polymerase) activity. The antibodies are useful for inducing an immune response against the cell cycle proteins. This sequence represents the tankyrase H isoform 1, Taho E/A C, which contains a Cal to Ala mutation and has a truncated C-terminal containing a 2 amino acid insertion described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                      is mutated from Glu (wild type, see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New recombinant nucleic acid encoding a cell cycle protein, useful diagnosing and treating a cell cycle related disorder, e.g. cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence is the Tankyrase homologue isotype 1 (TaHo-1) protein of the invention. The invention also relates to the TaHo-2 protein. The TaHo-special are useful for inducing or preventing cell proliferation in cells, and in the study or treatent of conditions mediated by the cells, and in the study or treatment of conditions mediated by the cell cycle proteins, such as to diagnose, treat or prevent cell cycle associated disorders, preferably cancer. The TaHo coding sequences are useful as hybridisation probes, in chromosome and gene mapping and in the generation of anti-sense DNA and RNA. The coding sequences are also useful for the preparation of TaHo, for generating either transgenic and screening of therapeutically useful agents, in gene therapy, as vaccine, and for construction of hybridisation probes for mapping the gene which encodes TaHo and for the genetic analysis of individuals with genetic disorders. The TaHo proteins, and their coding sequences are

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                780
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               300
invention have cytostatic and immunostimulant activity and can be used for gene therapy and in vaccines. The cell cycle protein TaHo and the nucleic acid encoding the protein are useful for diagnosing and treating a cell cycle related disorder, e.g. cancer, or for inhibiting growth of a tumour cell. The methods are useful for screening for a bioactive agent capable of binding to a cell cycle protein tankyrase H, or a bioactive agent capable of modulating a cell cycle protein tankyrase H or pare (poly ADP-ribose polymerase) activity. The antibodies are useful for inducing an immune response against the cell cycle proteins. This sequence represents tankyrase H isoform 1, TH-1, described in the
                                                                                                                                                                                                                                                                                                                                                                                                             9

This invention describes a novel recombinant nucleic acid encoding the cell cycle protein TaHo, a tankyrase H isoform. The products of the invention have cytostatic and immunostimulant acitivity and can be used for gene therapy and in vaccines. The cell cycle protein TaHo and the nucleic acid encoding the protein are useful for diagnosing and the nucleic acid encoding the protein are useful for diagnosing and treating a cell cycle related disorder, e.g. cancer, or for inhibiting growth of tumour cell. The methods are useful for screening for a bioactive agent capable of binding to a cell cycle protein tankyrase H, or a bioactive agent capable of modulating a cell cycle protein tankyrase H or PARP (poly ADP-ribose polymerase) activity. The antibodies are useful for inducing an immune response against the cell cycle proteins. This sequence represents the tankyrase H isoform 1, TaHo-1, isolated from clone TH-1 which is described in the disclosure of the invention

Sequence 1100 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method for screening a bioactive agent capable of interfering with the binding of a tankyrase H cell cycle protein and p21. The invention is useful in gene therapy. The method is useful for screening for a bioactive agent capable of interfering with the binding of a tankyrase H cell cycle protein and p21 for preparing a composition for diagnosing or treating cancer. The present sequence is human tankyrase homologue isotype 1 (TaHo-1).

                                                                                                                                                                                                                                                                                     protein e.g. tankyrase homologue (Tatho), comprising an amino acid sequence of ADY97761 or the 1240 amino acid sequence of ADY97762. Also described: (1) diagnosing cancer, which involves determining the activity of (1) from a test sample of an individual and comparing the level with a cell control with a control; (2) treating (M1) an individual with a cell cycle related disorder, which involves determining the level with a cell cycle related disorder, which involves administering to the individual an inhibitor of Tatho; (3) a recombinant nucleic acid (11) encoding (1), comprising a nucleic acid that hybridizes under high stringent conditions to a sequence complementary to the 379 base pair sequence of ADY97769 or the 3816 base pair sequence of ADY97760, (4) an expression vector (11) comprising (11) operably linked to regulatory sequences recognized by a host cell (1V) transformed with the nucleic acid; (5) a host cell comprising (11) operably linked to regulatory sequence call (1V) transformed with the nucleic acid; (5) a host cell comprising (11) or (11); (6) producing (17); (7) a polypeptide that expression of cell, involves contacting the tumor with a bioactive agent capable of inhibiting Tatho activity. (1) is useful for screening a boactive agent capable of individual with a cell cycle related disorder. (M2) is useful for individual with a cell cycle related disorder. (M2) is useful for call, involves individual with a cell by a bioactive agent e.g. antisense the human tankyrase become activity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            909
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           661 VAALLIKYNACVNATDKWAFTPLHEAAQKGRTQLCALLLAHGADPTLKNQEGQTPLDLVS 720
                                                                                                                                                The present invention provides the protein and coding sequence for the human tankyrase2 protein. This is found in two different verations, designated TANK2-LONG and TANK2-SHORT. Tankyrase2 has polyADP-ribosylation activity and is involved in the modification of TRF1, which is a telemere-specific binding protein. The regulation of telemere length, in which TRF1 has a role, is all linked to against and cancer. The sequences are useful in the treatment of cancers and inflammatory
                                                                                                                                                                                                                                                                                                                            09
                                                                            New tankyrase2 polypeptides, useful for treating conditions mediated by poly(adenosine diphosphate-ribose) polymerase activity e.g. cancers, inflammatory and autoimmune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              NCHNKSAI DLAPTPQLKERLAYEFKGHSLLQAAREADVTRI KKHLSLEMVNFKHPQTHET

nucleotide sequence selected from any of 948 sequences (17 complements) and nucleotide sequence selected from any of 948 sequences (18211119).

AB212066) or their mature protein coding portion, active domain coding protein or complementary sequences. The polymucleotides are useful for identifying expressed genes or for physical mapping of human genome. The encoded polypeptides (ABP68902-ABP69849) are useful as molecular weight markers, as a food supplement, for generating antibodies, in medical imaging, screening and diagnostic assays and for treating cell-proliferative disorders (cancer), neurodegenerative diseases (Parkinson's or Ablaheimer's diseases), autoimmune diseases (multiple sclerosis, placeter or coagulation disorders, wound, burns, incision, ulcers, liver or lung fibrosis, infections (bacterial, viral, fungal, parasitic), arthritis, etc. Note: The sequence data for this patent did not form part of the princed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The specification describes a method for identifying a candidate adenomatous polyposis coll protein (APC) and axin pathways modulating agents. The method comprises providing an assay system comprising a modifier of APC and axin (MAPCAX) polypeptide or nucleic acid, contacting the assay system with a test agent under conditions where, except for the presence of the test agent, the system provides a reference activity, and detecting a test agent-biased activity of the assay system, where a difference between the test agent-biased activity and the reference activity identifies the test agent as a candidate APC and axin pathways
                                                                                    900
                                                                                                             996
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying a candidate adenomatous polyposis coli protein (APC) and axin pathways modulating agent for treating cancer by contacting an assay system comprising a modifier of APC and axin polypeptide or nucleic acid

modulating agent. The method is useful in identifying a candidate adenomatous polyposis coil protein (APC) and a pathways modulating agent which are useful for sparing a composition for diagnosing or treating cancer. The present sequence represents a human orthologue of a Cancer. Accordabolitis elegans MAPCAX polypeptide. The sequence was identified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ADDVSALLTAAMPPSALPSCYKPQVLNGVRSPGATADALSSGPSSPSSLSAASSLDNLSG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides the protein and coding sequence for the human tankyrase2 protein. This is found in two different versions, designated TANK2-LONG and TANK2-SHORT. Tankyrase2 has polyADP-ribosylation activity and is involved in the modification of TRF1, which is a telomere-specific binding protein. The regulation of telomere length, in which TRF1 has a role, is linked to ageing and cancer. The sequences are useful in the treatment of cancers and inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          549
                                                                                                                                                                                                                                                                                                                                        The present invention provides the protein and coding sequence for the human tankyrase2 protein. This is found in two different versions, designated TANK2-LONG and TANK2-SHORT. Tankyrase2 has polyADP-ribosylation activity and is involved in the modification of TRF1, which is a telomere-specific binding protein. The regulation of telomere length, in which TRF1 has a role, is linked to againg and cancer. The sequences are useful in the treatment of cancers and inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9

This sequence is the Tankyrase homologue isotype 2 (TaHo-2) protein of the invention. The invention also relates to the TaHo-2 protein. The TaHo proteins are useful for inducing or preventing cell proliferation. The TaHo cells, and in the study or treatment of conditions mediated by the cell cycle proteins, such as to diagnose, treat or prevent cell cycle associated disorders, preferably cancer. The TaHo coding sequences are useful as hybridisation probes, in chromosome and gene mapping and in the generation of anti-sense DNA and RNA. The coding sequences are also useful for the preparation of TaHo, for generating either transgenic animals or knock out animals which, in turn, are useful in a development and screening of therapeutically useful agents, in gene therapy, as vaccine, and for construction of hybridisation probes for mapping the genetic disorders. The TaHo and for the genetic analysis of individuals with genetic disorders. The TaHo proteins, and their coding sequences are

The products of the invention have cytostatic and immunostimulant activity and can be used for gene therapy and in vaccines. The cell cycle protein TaHo and the nucleic acid encoding the protein are useful for diagnosing and treating a cell cycle related disorder, e.g. cancer, or for inhibiting growth of tumour cell. The methods are useful for askyrase H, or a bioactive agent capable of binding to a cell cycle protein tankyrase H, or a bioactive agent capable of modulating a cell cycle protein tankyrase H or PARP
